# Google API

In the image you can see the google API console. in this console you can assign several domains depending on where the API will be run, You just have to press the button to add new url and place the domain where you want to run the API. All access keys are generated from said console.

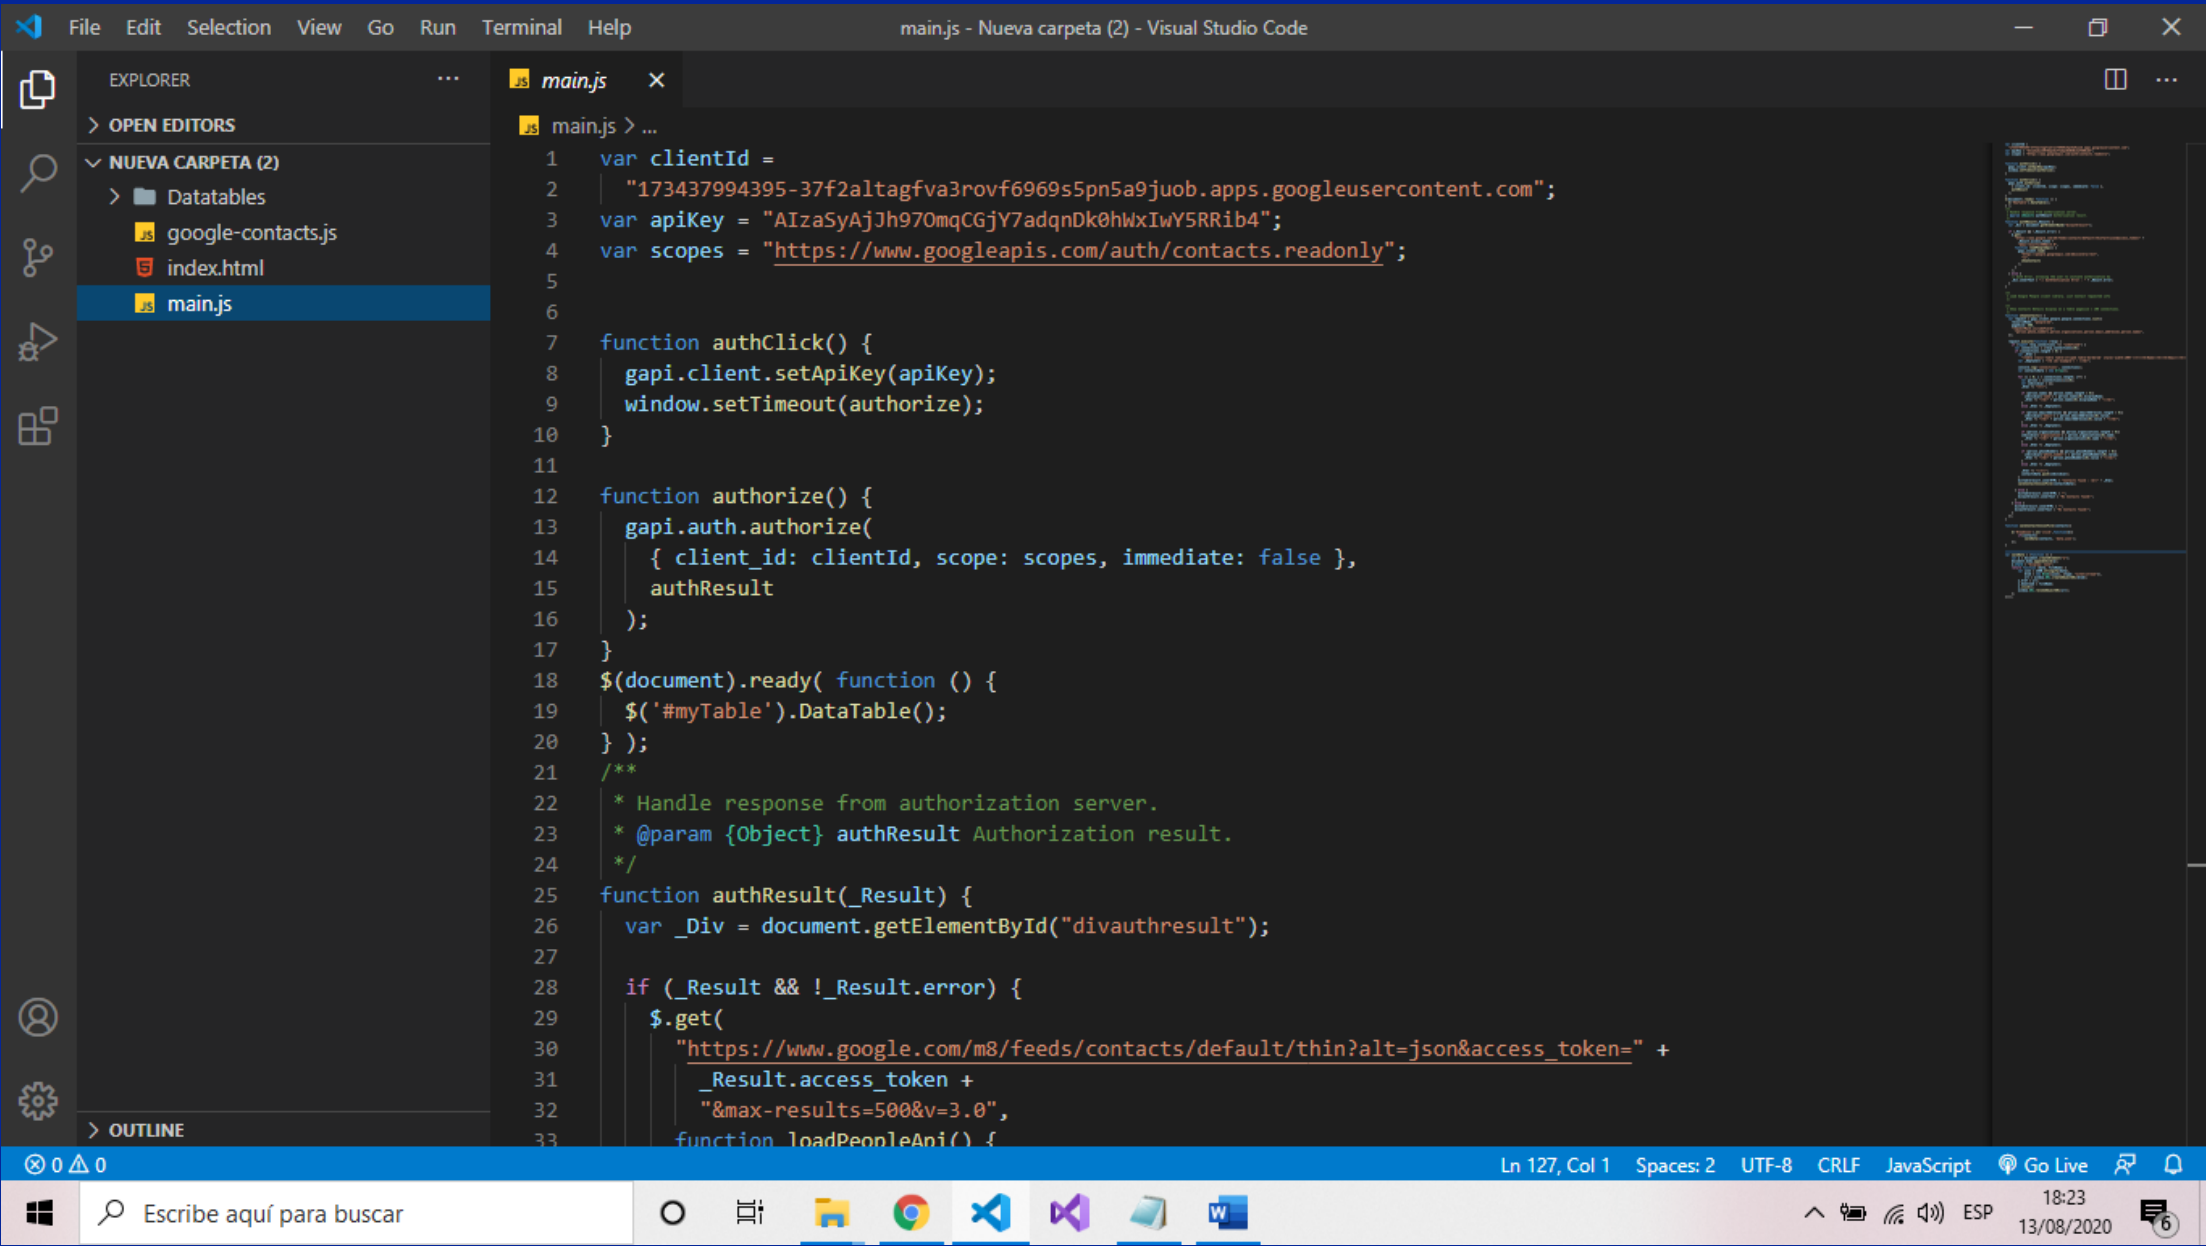

Google-contacts.js:
Necessary resource that allows the correct functioning of the API in javascript.

Index.html:
Html file that generates the data in a table and download the json with the data from google API.

main.js:
Performs the authorization, creation of the table, and generation of the json file with the data from google contacts.

To configure the console you can enter the following link:
https://cloud.google.com/maps-platform/
In the upper right corner you will find a button called console.

if you want to generate new passwords you should change the variables
var clientId
var apiKey
with their respective new keys.
